

DAVID MORGAN

You've spent a fortune on Microsoft security.
I'll tell you if it actually works.

Most organisations running Microsoft 365 or Azure have configured their security controls. Fewer have independent confirmation that those controls are actually working. That gap between assumption and reality is where I work.

**27 YEARS IN
CYBERSECURITY**

Senior roles across technical delivery, proposition development and commercial leadership at some of the most recognised names in the industry. Key credentials such as CISSP, ISSAP and Microsoft technology certifications.

IN THEIR OWN WORDS

David is one of the rare few, he is highly technical yet has the ability to relay technical risk fluently in language that C level can comprehend. He has a fantastic understanding of risk and this is demonstrated in the way he provides sensible risk ratings as part of his deliverables. He is a very professional individual, understands tactical and strategic drivers, someone it was a pleasure to work alongside as a client.

-- Senior Cyber Risk Manager, BIG 4 Consultancy

Dave is one of a rare breed of highly technical security professionals that can articulate business risk to senior management without getting lost in the technical minutia. A safe pair of hands that I look forward to working with in the future.

-- Head of Security Assurance, Financial Services

David was retained to provide expert advice to myself and the Head of Security on all Penetration Testing matters. This included scoping, organisation, interpretation of results and recommendations for the appropriate countermeasure or remediation.

David's level of skill is very high and he is able to take the sometimes complex results and reinterpret them into a more user-friendly format for non-technical management. I would have no hesitation in hiring David for any CHECK or Penetration Testing work that needed doing and is a considerable asset to his current employer.

-- Lead Security Architect, UK Government Client

WHAT I ACTUALLY DO

Three engagements. Fixed price scoped to your environment. Delivered personally.

Microsoft 365 Security Assessment

Microsoft 365 ships with powerful security controls. Whether those controls are genuinely enforced across identity, access, data protection and monitoring, rather than simply enabled in the portal and never revisited, is rarely confirmed after initial deployment. I assess whether your M365 environment is as secure as you believe it is.

Azure Security Assessment

Your Azure environment was configured under pressure to get things running. Whether it is still configured correctly, with appropriate boundaries, least privilege enforced, and no silent drift since go-live, is a question most organisations have never formally answered. I verify whether your Azure security posture is genuinely enforced and operating as intended, not simply assumed to be.

Penetration Testing

Knowing whether your defences hold requires someone to test them the way an attacker would. I deliver network, infrastructure and application penetration testing at senior level, decades of delivery at major consultancies, applied directly to your environment without the overhead. Findings are prioritised by what actually enables compromise, not CVE scores.
